Ocular histoplasmosis like ocular changes in a non-endemic area.

Authors: Miguel H. Amaro Cristina Muccioli

Purpose: to describe five cases of ocular histoplasmosis like changes in patients in a non-endemic area.

Methods: Five patients, four women and one man, between 33 to 45 years old were analyzed. One patient presented with an enlargement of a previous scar, the other patients showed multiple PED, histo spots and CNV.

Results: the laboratorial exams for histoplasmosis disease were negative.

Conclusion: we related some cases that we could understand as a part of ocular histoplasmosis syndrome but the negative laboratorial exams suggest to us the possibility of the cause to be a non-typical mycobacterium.
