**Development of Capacities of the egressed students from the MBA  
Administration in Health of the Vision Institute Manuel Meireles**

Objective: To investigate if there is lineal and positive correlation between MBA Administration excellence in Health of the Vision Institute and the development of capacities of the egressed students. Methods: The present research can be characterized as a field study, accomplished through the survey technique. It is also a research of descriptive nature. The research was accomplished through applied questionnaires to former students of the MBA Administration in Health with  $n=30$ . The analysis of the collected data was made through parametric and non-parametric methods:  $r$  of Pearson and  $Q$  of Yule; tests  $t$  of Student, of the sum of series, of the medium and Test  $U$  of Mann-Whitney. Results: The variables considered in the test of this hypothesis were MBA Administration excellence in Health, of the Vision Institute that obtained an approval of 98,33% and the development of capacities of the egressed students. The results show that the veterans present significant development of capacities, with approval  $\geq 95,00\%$ , especially the following: (1) capacity to commit with the objectives of the organization; (2) domain of new technical knowledge associated with the exercise of position or busy function; (3) capacity of interpersonal relationship; (4) action initiative and decision; and (5) enterprising capacity. The correlation between MBA Administration excellence in Health and the development of capacities for the egressed students, according to the non-parametric test of Spearman, is significant to the level  $\alpha=0,01$ . There is a significant correlation between these two variables, by  $r$  of Pearson = 0,782 with  $p$ -value = 0,000. Conclusion: The hypothesis that there is lineal and positive correlation between MBA Administration excellence in Health and the development of capacities of the egressed students is not rejected.
