**Burkitt Lymphoma manifesting as a orbital mass in a child HIV positive**

Karine Duarte, Luis Paves, Paulo Góis Manso, Nilson Lopes da Fonseca

Purpose: To report a case of orbital involvement with Burkitt Lymphoma in a child HIV positive. Methods: A 28-month-old girl developed painless right proptosis. CT imaging demonstrated diffuse mass involving the right orbit. Systemic examination demonstrated a HIV test positive. Incisional biopsy of the orbital mass was performed. Results: Histopathology demonstrated cells suggestive non-Hodgkin's lymphoma (Burkitt). Conclusions: Orbital involvement with Burkitt lymphoma is a unusual diagnostic in child HIV positive.
